Access keys

Twelve seeded accounts across the three areas of NexABI. Every one is a real user with a hashed password — sessions, role weighting and area isolation behave exactly as they would in production.

PASSWORD · ALL ACCOUNTS `password` Sign in at `/login`

Admin console `/app`

6 accounts

Six seats across four role lenses. The lens re-ranks the insight feed for whoever is looking — it never filters it, so a finance risk does not stop existing when a sales manager signs in.

`ada@anchorstone.ng`

CEO / Managing Director

Start here. Ranks by revenue impact and shows the widest spread of findings across every area of the business.

• BEST FIRST LOOK Copy

`tunde@anchorstone.ng`

Sales Manager

Pipeline, realtor performance and conversion float to the top.

Copy

`ngozi@anchorstone.ng`

Finance Lead

Collections, receivables and payment risk lead the feed instead.

Copy

`segun@anchorstone.ng`

Sales Agent

The narrowest lens — own leads and the properties they want.

Copy

`funke@anchorstone.ng`

Sales Manager · Island

Second manager seat, for comparing two people on the same lens.

Copy

`ibrahim@anchorstone.ng`

Sales Agent · Mainland

Second agent seat, on the Mainland book.

Copy

Realtor area `/realtor`

2 accounts

Open both. A demo that only ever shows the approved state never shows the approval gate working — and the gate is half of what the realtor model is.

`realtor@anchorstone.ng`

Chidi Chukwu

Approved. Referral code and registration link, own leads, the catalogue with commission shown per unit, personalised materials, and a commission statement.

● APPROVED Copy

`pending@anchorstone.ng`

Folake Adeleke

The holding screen. Signed up and waiting — no code, no leads, no catalogue. Every other realtor URL redirects back here until an admin approves them.

AWAITING APPROVAL Copy

Investor portal /portal

4 accounts

Four genuinely different positions, planted on purpose. A portal demo that only ever opens on a healthy account never shows what the product does when something is wrong.

`client@example.com`

Oluwadamilare Okoro

Behind. Two of three instalments paid, one past due — the banner tells them what it costs and offers a way out.

OVERDUE Copy

`buyer2@example.com`

Adaeze Anyanwu

On schedule. One of six paid, nothing late, next date shown.

ON TRACK Copy

`buyer3@example.com`

Chinyere Fashola

Nearly done. Three of four paid, with the last one past due — the awkward case, near the finish and still in arrears.

OVERDUE Copy

`buyer4@example.com`

Ezinne Okwuosa

Settled. Paid in full, documents released, journey complete.

SETTLED Copy

Two things that shift between seeds

Names are generated. The person behind an address changes on a fresh `php artisan migrate:fresh --seed`. The address, the role and the situation do not.

The realtor's referral code is minted at approval, so it differs on every seed. Read it off the Realtors screen in the console, or the realtor's own dashboard, rather than memorising one.

Balances move with the clock

An instalment's status is worked out from its due date against the real current time on every read — never from a stored column. An account one day from due today is overdue next week without anybody writing to the database, so the positions above drift as time passes. The Time Machine in the console moves them on deliberately.
